

BECKHAM YEOH

San Diego, CA | beyeoh@ucsd.edu
beckhamyeoh.github.io/GamePortfolio | linkedin.com/in/beckham-yeoh | github.com/beckhamyeoh

EDUCATION

University of California, San Diego

Bachelor of Science in Computer Science, 3.66 GPA

Expected June 2027

San Diego Miramar College

Associate in Science in Computer Science for Transfer, 4.0 GPA

June 2025

Relevant Coursework: Advanced Data Structures, Software Engineering, Design and Analysis of Algorithms, Computer Assembly Language, Digital Systems Design, AI Search & Reasoning

EXPERIENCE

Software Development Engineer Intern

IDX Exchange

June 2026 – September 2026

- Built a full-stack property search app (React, Node.js/Express, MySQL in Docker) on a real MLS dataset of 53,000+ listings and 4,200+ open-house records.
- Designed a REST API with validated filtering and pagination by city, ZIP, price, beds, and baths, using parameterized queries through a MySQL connection pool.
- Developed property detail pages with a photo gallery, Google Maps embed, and open-house schedule, plus saved favorites and search filters that persist in the URL.
- Hardened the app against messy source data (malformed photo JSON, mixed-case cities, missing coordinates) so bad records fall back gracefully instead of breaking the page.
- Covered the API and UI with 39 Jest, Supertest, and React Testing Library tests, reaching 83% backend coverage.

Mobile App Prototype Tester

LifeSpark Labs

August 2025

- Ran test passes on a pre-release mobile app, reporting usability issues and detailed UI/UX feedback that developers used to refine features before launch.

Astronomy Research Assistant

San Diego Miramar College

June 2024 – August 2024

- Analyzed binary-star orbital models using Fourier transforms, tuning simulation parameters to improve model accuracy.
- Collaborated with a team of astronomers and programmers to process and evaluate datasets.

PROJECTS

Ophir's Revenge | Unity, C#

- Shipped a complete boss fight in one week with one partner for Boss Fight Jam; placed 5th of 18 overall and 3rd in Game Design.
- Designed the core loop around arrow scarcity: the player carries at most four arrows and has to scavenge spent ones mid-fight.
- Wrote the player controller, charge-based bow, a boss-stunning trap that opens a timed weak point, HUD, game flow, and audio.
- Coordinated work over Git by splitting prefab ownership between developers to avoid Unity scene merge conflicts.

Unity Game Portfolio | Astro, Unity WebGL

- Built a portfolio site hosting 6 playable Unity games in the browser, including flocking steering behavior (Boids), physics-based projectile gameplay (Mission Demolition), and a shoot-'em-up with object pooling and a multi-phase boss.
- Automated deploys with GitHub Actions, serving gzip-compressed WebGL builds from GitHub Pages on every push.

Arduino Obstacle-Avoidance Rover | C++, ESP32

- Programmed an autonomous rover with ultrasonic obstacle detection, avoidance logic, and an automated signaling system for turning and reversing.

Assembly Language Encryption | Assembly

- Built a program that encrypts and decrypts text messages using ASCII-based key comparison.

TECHNICAL SKILLS

Languages: C++, C, C#, Java, Python, JavaScript, SQL, Dart

Frameworks & Tools: Unity, React, Node.js, Express, MySQL, Docker, Git/GitHub, Jest, Arduino IDE, Cinema4D

Spoken: English (Native), Vietnamese (Conversational), Japanese (Elementary)
